

7 **KhanAcademy** (<http://dgit.in/FTKhanAcademy>)

Khan Academy, the brainchild of Harvard and MIT alum Salman Khan (no, not the Bollywood star), is at the forefront of revolutionizing online education. His team of educators based in Mountain View, California, have created a massive repository of courses spanning Math, Science, Computer Science, History, Literature and Economics. These courses consist of video lectures where the camera focuses on the blackboard, and many courses have built in supplementary material to facilitate learning.

Khan Academy's courses are usually at a more fundamental level, targeting high-school or young college students, though anyone looking to quench their curiosity can choose to take them. They're completely free of cost, and while students would initially use them as a supplement to in-class learning, it is slowly becoming the primary learning tool for a lot of students. Khan Academy has actually partnered with schools and provides detailed metrics of a student's performance to teachers, allowing them to pinpoint the areas where a student needs improvement. Teachers assign videos to students to be watched at home in their own time, and homework assignments are typically completed in class, allowing students to seek the help of their teachers with any difficulties. The approach taken by Khan Academy allows students who've mastered a particular topic to move on to more advanced ones, thus allowing each student to learn at their own pace. This approach benefits the teachers as well, as they're able to provide a more personalized level of coaching to their students.

8 **University of Reddit** (<http://dgit.in/UReddit>)

Reddit prides itself in being the "front page of the internet", and with good reason - the site attracts millions of visitors each month, driving huge amounts of traffic to other parts of the internet. One hidden gem of Reddit, though, is University of Reddit - a crowdsourced MOOC platform, where anyone with a desire to learn (or teach) can find what they're looking for. Redditors put up posts on what they want to learn (or teach), and if enough people favour the idea, the idea takes the form of an online class.

The courses are very varied, from short tutorials like "How to draw a woman's face" to more general "Introduction to Programming" type courses. The courses are quite informal, and you won't receive a certificate of completion, but University of Reddit is full of highly specific, niche type
