

aimed at absolute beginners at attempt to teach web programming using standard tools such as HTML, Javascript, CSS and Python.

Learnstreet combines both text-based tutorials as well as instructional videos to aid its teaching, but the number of 'courses' that you can take are limited to just Javascript, Python and Ruby (which isn't too bad, considering they're the three most widely used languages on the internet). It sports an in-browser Interpreter (since all three are interpreted languages) where you can interactively try out the coding exercises. Hints are available if you run into any difficulty, along with the supplementary videos. The real strength of LearnStreet, however, lies in its vast selection of projects with varying levels of difficulty - a Sudoku solver, a unit conversion tool, a game of hangman - that students can use to challenge themselves once they've grasped the basic concepts.

Earn badges while you learn to code with Codecademy

Codecademy offers a wider range of courses, including jQuery, Ruby, PHP, Python and even a track where you're introduced to using various APIs including YouTube, Twitter, SoundCloud and Evernote. Using APIs is a very important skill in any programmer's toolbox, for when you're actually building a website or an app, chances are you'll need to integrate
