

Science (ScD) in astronautics from MIT university in 1963.

Taking a step towards free education, MIT university, under its Office of Digital Learning, established MIT OpenCourseWare (OCW) under which it has made its

classroom-based educational material available freely online for more than a decade. The course material consists of notes, syllabi, assignments and examinations and covers around 2,180 undergraduate and graduate courses at MIT. The content has been accessed by around 170 million people worldwide. Out of the total number of people who access OCW, India accounts for close to 9 per cent of the same. Hopefully, with cheap and deeper broadband penetration in India, more people are able to access the OCW content.

The courses are available across a wide variety of topics like Business, Energy, Engineering, Fine Arts, Health and Medicine, Humanities, Mathematics etc, with each of them having multiple subtopics. For example, the Engineering topic contains subtopics like nanotechnology, aerospace engineering, biological engineering, etc., while the Health and Medicine topic contains subtopics like biomedical enterprise, biomedicine, spectroscopy, biomedical signal and image processing, etc.

These courses are not merely explanatory ones but they delve in depth with that MIT quality of knowledge.
