

tion of short video lectures. Long enough to give you an idea of the topic being discussed and short enough to keep you from getting bored. TED is a non-profit dedicated to “ideas worth spreading”. TED talks are conferences given by experts on subject matter in their particular field. There also talks given by entrepreneurs on new ideas and developments. TED is an acronym for Technology Entertainment and Design. These are the fields it started out with in 1990 but has grown to be far more.

The team at TED decided to bring their talks to the mobile platform so that they are more accessible to people on the go. It started

with the Android platform and more recently shifted to the iOS platform as well. They have made it so that it runs on almost every device, is extremely user friendly and users can even view the videos offline.

The talks are available with over 90 languages available as subtitles. Even the menu can be browsed in the language of your choice.

The only criticism that one could have is the sheer quantity of content. It can sometimes get overwhelming especially if there are topics that don't feature in your interest list. To counter this you can use the app's 'Inspire Me' function and choose what sort of videos you want to be presented with rather than browse through all the topics.

There is also a 'Featured Content' section which is constantly populated with new and current talks so that you are kept up to date.

Another thing to note is how optimized the app is. Videos load almost immediately with no downtime between selection and play. This makes it faster perhaps than watching it online through the website.

For anyone wanting to learn a little bit about a wide variety of topics this should definitely be your go to app.
