

Codebox

Code box takes e-learning to a whole new level. It helps you learn how to code within an app. Since learning to code is a basic necessity of almost any academic course to do with science or engineering the developers of Codebox aptly named ‘The Codeguys’ thought they would try and make things a little more enjoyable and accessible. In October 2013 they released Codebox which serves as a reference to all the computer programming problems one may have. It deals with two programming languages – Java and C. It covers the basics and has solutions and explanations to most interview and examination questions. There is pseudo code for all your basic questions like binary search, comparison of strings, all the sorting algorithms etc. For a beginner coder Codebox is extremely helpful, for more advanced coders it serves as a good fall back and reference for old but important algorithms.

The user interface is neatly laid out and categorizes programs for easy access. It takes up the whole screen avoiding distractions highlights important lines of code so that you know which areas to focus on. Usually with big chunks of code, a student gets lost and confused which makes them feel like giving up. Codebox has a sample input and output feature which makes it very easy to analyze the working of the code and go step by step without losing track of where you are. The programs are ‘searchable’ which is an major advantage.
