Now that we're done with developing the course content, here comes the choosing the LMS part. The problem is there are a thousand different options to choose from, with most of them pretty expensive. So here we list some of the best free/open source LMS that you can use: (Note: open source doesn't necessarily mean free. Certain optional peripherals and support from third parties can cost money, apart from the cost of the internal tech resources needed to implement and maintain the open source solutions)

- ▶ **Moodle:** Moodle is arguably the biggest name in e-learning today. It is an open source LMS software, so it's constantly being upgraded and developed. It is aimed primarily at the education market but is also used by corporations for their training purposes. Moodle has more or less everything you would expect in an LMS – student dashboards, progress tracking, support for multimedia etc. It is supported by a huge, active community and has tons of plugins and options for your
