

for a specific degree course and hence will get content only related to that specific degree.

In the case of e-learning, as we've seen in the previous chapters, the course material is divided into subject-based chapters which can be accessed individually. You can subscribe to specific chapters from different streams instead of taking the whole course.

Updates to study material

One of the problems of printed distance education study material is the inability to update it. Once the material has been printed, it can't be changed. New notes have to be sent for updated content, which may or may not involve a cost to the student.

E-Learning, on the other hand, due to its delivery methodology, has the benefit of being able to receive quick updates. As the courseware is downloaded or viewed online, all that an admin has to do is update the source files and the fresh content will be viewable by everyone.

Evolution of Learning

Technological breakthroughs can revolutionise the way distance education and e-learning courses are conducted. Below are a few such examples of innovations that could change the way education is dispensed:

- ▶ **Google Glass:** Imagine the feeling of seeing the tutor right in front of your eyes, as if you were sitting in the classroom despite being miles apart. The head-mounted display could just enable such a situation in the future. You could watch hands-free live broadcasts of the course lectures from the comfort of your home or even while on the go.
- ▶ **Google Fiber:** Watching content in high-resolution will never be an issue if you have breakneck broadband speed, ranging from 5Mbps going all the way up to 1Gbps (or 1,000Mbps). The hi-res images and videos that Google Fiber will aid when it's finally available everywhere (currently only present in a bunch of U.S. cities) will come in handy for scientific courses in which microscopic details are often shown.
- ▶ **Virtual Reality:** Undertaking a course which requires the student's physical presence has always been an issue with remotely located students. Virtual reality would break this barrier and immerse you into an environment, which would simulate the physical nature of the course.
