

individual/complete e-learning modules that can be purchased and downloaded on demand – creating tailor-made solutions for students and businesses.

- ▶ **M-learning:** Mobile devices are becoming ubiquitous and have become an integral part of the lives of people. Thus, mobile learning will be able to deliver content to people on a platform that they are comfortable with. Mobile learning is suited to short bursts of information, thus delivering information to people when they most need it. Mobile learning, however, does not simply end at being e-learning on a mobile device. The nature of the content demands that different platforms ask for specific skill sets of their own in terms of development and design. Native apps, and not web apps, seem to be the direction M-learning is heading in, and this demands that each application be stored locally on the device allowing it to access the user data from the cloud if necessary. This concept of mobile learning along with the Bring Your Own Device (BYOD) trend – which we will discuss later – will change the way the next generation approaches learning.
