
The first step of Comodo backup

location on your computer, CD/DVD, a network location, an FTP Server or also E-mail (depending on the backup source and format). If you want you can directly start the backup in the second step itself or schedule it for a later time, or you can go to the third step where you can modify the backup settings and then proceed with the backup. In the third step, before you backup, you can change the settings for the compression level, type of encryption, filters, Email Notification settings, and much more.

DriveImage XML

DriveImage XML, with its absolutely spartan interface, is one backup software that you will absolutely love or hate, depending on your requirement. It is a no nonsense backup tool which allows you to do only full backups of partition/s or the whole hard drive. Taking a backup is very simple. Simply go to the backup option and select the drive/s that you want to backup and click next. This will take you to the backup wizard through which you will select the backup location and the sparse options for backup settings. You get the option of setting compression level and also the option to copy the data sector by sector (this way even unused space will be copied) through raw mode. The backup creates two files, one dat file which contains the data and an XML file that contains the
