

being uploaded, and the connection is secured using TLS. Backups are continuous - i.e. your files are backed up by the minute. In the event of a catastrophe, Crashplan will even courier you a hard drive containing all of your data. Subscriptions start at \$4/month if you sign-up for a four-year plan. Business users can also avail of administrator functions by managing backups across multiple devices.

Crashplan is a fantastic option for those looking for a truly cross-platform, secure and automated backup solution

Crashplan isn't available in the default repositories of popular distros, so to install it, you'll need to download the installer from their website at <http://dgit.in/CrashPlanInstall>. It's a simple process that involves downloading an archive and then running a script, and they have step-by-step instructions on their site.

Where do I store my backups?

We're glad you asked. It's important that you give careful thought to where you're going to store your backups, for if the physical medium (or cloud provider) were to fail, it would result in massive data loss.

All backups must have an offline and an online copy for redundancy, so should your cloud storage provider go down (or face data loss due to syncing issues), you have a physical, offline copy handy. A NAS drive (Network Attached Storage), network location or even a dedicated Hard Disk will work well for a physical backup. For your cloud provider, we suggest you take a look at one of these:

1. **Dropbox** is by far the most popular file syncing tool, and while it is NOT a backup tool, it can work great as a secondary location to store your archives. The Dropbox client for Linux (available either as an Ubuntu package or a Python application) works well, monitoring your Dropbox folder for any changes, and syncing these changes to the cloud. While
