

can be used to streamline your shopping experience too. Tired of wasting precious seconds keying in your valuable information? Well, waste no more with LastPass.

KeePass

Staying in sync on the nomenclature front is the next product on our list. KeePass is a free, open source password manager that works on Windows, Mac, Linux and Mobile. The fact that it can boot off a USB drive makes things a lot more interesting. But you're not going to get any self learning, auto form filling magic. Just a master password and a database of every account you keyed in.

Once you've installed KeePass, you are greeted by a pretty basic interface. Clicking on the 'New' button lets you start a new database with its own separate password. Once your database is named, you can get down to business. The entire interface is divided in two. The left side contains a list of nested directories and the right displays the contents of each. Right-click on the right and you can create a new entry. Once done, you can individually copy usernames and passwords or you can make it do tricks by hitting Ctrl + V. This is the auto-type command and KeePass automatically switches between itself and the appropriate dialogue boxes and

fills it up. Just make sure the correct website is open in the background and not MS Word.

The really cool thing about KeePass is that it supports plugins. There are a lot of them out there which slowly, but steadily take KeePass up to the level of anything else in the market. Plugins like KeeFox and ChromeIPass allow you to

Getting this does not make you something that rhymes.

link your KeePass database to your web browser enabling auto-filling, password management and more.

If you save your database to your dropbox folder, you can connect the appropriate apps for other devices to the database and sync your accounts across all your devices.
