

alities. One kind hardly searches for stuff and gets his recommendations from social media. This is someone who doesn't save too many bookmarks and enjoys reading material that he deems interesting on his Twitter or Facebook feed. He might not bookmark pages he goes through and isn't bothered whether he's logged in to Google when utilising its search engine. Such a person has hardly any browser data to back up.

The other kind searches for precisely what he wants to read, and is subscribed to blogs and new feeds. He has a long reading list, is up to date with latest developments in his field of work and probably has a list of videos and pages to go through. Such a person would need many tools to back up his digital life.

Most web browsers today come with a sync service built in. Mozilla Firefox, Google Chrome (and Chromium browser), Internet Explorer, Opera and Safari each have their own sync servers. All you need to do is log in to the service/s via one of these browsers and all your tabs, history and bookmarks are synced and immediately available on your other devices. Syncing your web history and bookmarks are no longer a problem as long as you're using the same browser across your devices (which can be an issue if you're addicted to either Internet Explorer or Safari, since both have limited presence across multiple devices).

Sync your contacts

If by any chance you happen to be a Mac and/or iPhone user, you won't have to worry about syncing your contacts. Once you associate your Apple ID with all your devices, they all get the same contact list as and when Apple contacts its servers over the internet.

For the rest of humanity, the non-Apple owners, you probably need to take a few steps to ensure your contacts are always up to date. Google is the best possible solution for this among many others, including Microsoft.

Apple allows you to sync with many services
