The Editing Toolbox contains similar tools as video editing software - Selection and Blade - along with audio specific tools like Loop and Keyframing. The Loop tool allows you to easily have a single finite duration of audio play in a loop as long as you wish and be very handy when you don't have enough recorded material. The Keyframing option is a critical audio tool as it allows you to edit the audio file in a very detailed and smooth manner, for example you can insert "keyframes" at two specific points of an audio file and define how you wish the volume or tempo to change. The software lays out the smoothest preset for the transition which you can either use or edit to any degree you like.

Layout, Workflow and Essential Tools of Image Editors

Image editing by far is the most familiar editing option known by most people. We shall be discussing it briefly and with specific focus on how it can

be used in multimedia productions. Anyone who has a mobile device has experimented with photo editing either through apps like Instagram or even their on-board camera settings. Using different filters and settings is not the highest form of photo editing since it uses presets that offer little

manual control. For real photo editing we need to look towards raster layer based file editing software like Photoshop, Lightroom or GIMP.

The typical layout for a photo editing option can vary greatly depending on what is the key utility of the software being used. In tools like Adobe Lightroom the focus is on pure photographic editing with little regard for design, while GIMP is a highly versatile editing environment that gives complete control for even the most subtle changes that include design. The common features are as always a Workspace - where your image is displayed, an extensive Toolbar that offers a wide range of tools that allow
