

One of its useful features is its dual nature where it can also be used as a plug-in for other editing software like Sony Vegas and Adobe Premiere Pro. The software comes with all the necessary goodies such as a decent effects library, transitions, audio editor, 3D text maker, VFX effects like explosions and particles along with the use of 3D models. Another unexpectedly great feature is the applications ability to leverage your 3D GPU to give great quality special effects very fast, almost in real time and since there are over 500 different included preset effects you can get almost anything you might need to make your footage look spectacular. The open nature of the software also lets you use presets and filters from VirtualDub, GreeFrame and Movie Maker. Thankfully it also comes with a comprehensive Help file which is great to get started. The only significant downside with Wax is that although it exports Flash format as well, it doesn't accept it as an import but thats unlikely to be a major issue for most editors.

Jahshaka

Get it at: <http://www.jahsbaka.com/download/>

Run it on: Linux, Mac and Windows

Jahshaka claims itself to be an all inclusive media management, editing, playback, effects and compositing software that will “Reinvent Hollywood”. This open source application is very ambitious since it tackles not only video
