

Every user has their own unique needs. And with a rapidly emigrating population that's discovering mobile devices as the core of their digital life, multimedia editing is no different. Most of the footage that is recorded today is overwhelmingly done so on mobile devices like cell phones and tablets. From music videos to full fledged movies, mobile devices have become more and more media friendly with every generation. And with the significantly reduced prices of handsets with high quality recording features even the most basic of devices come with adequate sensors. The convergence of high definition video recording, internet connectivity and on-board app support makes it an obvious conclusion that a tablet or mobile can very easily become a unified location of recording, editing and releasing multimedia content.

We sift through the hundreds of available mobile apps for most of the major platforms. We have prioritised functionality and performance over equity of platform representation. So you might find a particular mobile operating system lacking, it's just because they don't really have the apps that match our requirements. We consider the portability of content made by these apps to see if they can be used in a variety of formats and mediums, and are not just restricted to the mobile device. And of course, all the apps we've looked at are free to download which automatically restricts the selection away from the major industry leaders.

Video

Perhaps the most difficult category for mobile apps considering how complicated and immense video editing set-ups are in general. Currently there
