

simplicity, ease of use and wide variety of options make it fairly well balanced considering the ads and instability issues the app brings to the table.

WeVideo

Get it at: <http://dgit.in/WeVideoAnd>

Run it on: Android and iOS

WeVideo promotes itself as a cloud-based video editor that can be run through an app. This however doesn't drastically alter its functionality in either direction of good or bad, since its basic features of editing together photos and videos with layers of music and sound effects doesn't seem affected. The app gives you the tools to trim videos on the timeline and choose from a preset group of transitions. The cloud part of the app

kicks in when you export the video since the rendering takes place in the WeVideo cloud. Only after the video is done rendering on the WeVideo cloud can it be downloaded to your device or shared on social media networks. Keep in mind that a copy is kept stored in your

WeVideo online account. The organisation of the app is elegant and easy to use which seems more handy when making quick videos but is dependent of an internet connection to get your final output.

Audio

In its most simplest avatar audio editing can be very compatible to the mobile device medium. With much of the automated changes usually required like vocal suppression and pitch shift easy to execute on a phone, there are other more subtle features that can be a challenge. Surprisingly given the visual nature of spectrographic waveforms and audio transitions the mobile device screen real estate is decently suited to making edits using just your finger on a touchscreen. We went through as many freely available audio editing apps currently available and were pleasantly surprised to find so many diverse candidates that could fulfil basic editing needs.
