

app doesn't offer much in the way of recording and multi-track editing but is a great add on for quick and easy clip making and format conversions. The layout is easy to use and gives a great visual display of the timeline for each track. Users can easily select any part of the clip in the timeline by either touch or by inputting the specific timecodes. The zoom option makes the precise selection even easier and allows you save your work locally.

GarageBand

Get it at: <http://dgit.in/iOSGarageBand>

Run it on: iOS

Any Apple user with even the slightest inclination towards music must've played around with GarageBand. The free app version available in the iTunes store is a great revision of what many users have seen on a Mac

OS. The app is highly reviewed and much loved for the ease and simplicity with which it allows even newcomers to create music from scratch. Using its vast library of true to life audio instrumental tones users can combine multiple tracks and instruments to create entire musical

compositions that sound just like the real thing. And as far as the world of touch screen is concerned the layout and user interface is as good as it can possibly get. The additional easy to use transition and effects tools in the app allow each composition to be layered and unique in sound and style. With their latest version the GarageBand app also allows users compatibility with Audiobus which brings in new sounds and effects from other apps and records them into GarageBand tracks. With eight track recording, mixing, virtual amp effects and over 200 loops there is no limit to the variety of music than can be created, edited and saved. The app also has Smart Instruments so that take away a lot of the struggle when working with a particular tune so anyone with basic sense of instruments and music can get started with editing without having to worry too much about instrumental composition.
