

editing process from the workflow to get users quickly and easily to their self-made movies. All this for free, not a bad deal.

FileLab Video Editor

Find it at: <https://www.filelab.com/video-editor>

The free to use online video editor from File Lab is actually one of the best cloud based editors for those people who just need a quick and easy way to edit videos. The layout plays around with the tradition style focusing on the transitions and effects. Video and other media clips are inserted into the timeline and can be trimmed, cropped or merged as needed with the transitions selection panel dominating the side of the screen. Along with the transitions we find that FileLab has built up their database of effects and titles options a great deal offering lots of options. Audio tracks are added separately using an Overlay option instead of being part of the video timeline. This option is used for adding multiple video layers as well with transparency effects option for enhanced visual styling. Once the final edit is done all that's left is to click the Make Movie and you can select your output format. FileLab gives a large number of options here as well including presets based on mobile and gaming devices. Just click Make Video File and you're done. It's just that easy.

Audio

Long before YouTube and iTunes came in to the picture users were already using the internet to work with audio. Given the thankfully small size of even high quality audio files the web is a great place to work with audio. And as newer codecs and compression formats emerge we find it easier to experience high quality with even low bandwidths. The overall problems of storage and bandwidth are also resolved with audio and the focus has been on improving the features and functionality of web based apps for editing. The top choices we offer are therefore relatively limited since we seek out free services. Most matured web applications are however paid or require some sort of payment for online data storage, which is an essential cost necessary to consider when choosing to work online but for small projects the free usage limits for many are more than enough for most people.
