

Using the WebGL framework technology the web service is able to use the graphics card of your machine through the browser to get the required power to edit RAW files. The layout and design of the working area is fairly elegant with the screen dedicated to the image with tools neatly organised on the sides in an unobstructive semi-transparent panel. The online service is also collaborative so you can work alongside people to edit and get review of changes. Pics.io is tied into your Google Drive for online storage needs and has a large enough data storage to allow for most users needs. The tools do a good job nearly at par with Lightroom however there are still occasional glitches that can slow down the workflow. This is expected to be resolved soon with more features and functionality being added as time goes on.

Google+ Photo Edit

Find it at: <https://plus.google.com/photos/>

Given the Google existence everyone has on the internet it isn't surprising that Google would offer an online image editing service as well. The Photo Edit option is a part of your Google+ account where you can upload and store images, now with a new Edit option in the images gallery. This editing service comes after the popular Picnik service for image editing was acquired

by Google in 2013. For now Google+ Photo Edit does a reasonable job in letting users make quick changes to photographs using Instagram like filters and also making detailed changes. The auto features do a decent job but you can also explore the fine tuning options to adjust brightness and contrast, and sharpness and structure, which along with handy sliders also have a selection of presets to choose from to make things easier. The interesting tool is of Selective editing which lets you pick any part of the image as a reference and make alterations from there - it takes getting use to but gives surprisingly good results once you get the hang of it.
