

the workflow or the steps required to produce a polished sequence in your timeline that is ready to export comes into the picture. The centre or left of centre screen is the preview display screen where you can view each clip in the Bin. Using this preview screen you can see the footage as it was shot and use In and Out markers to decide which parts of the clip you wish to use in your edit. These are the first two points that make up your “three point editing” workflow. The third point is based on where in your timeline the selection should appear.

If you're just cutting out the opening scene than it should appear at the 00:00:00:00 (HH:MM:SS:Frames) mark. This process of three point editing has been around since the beginning of editing and despite all new innovations remains the foundation of the editing workflow. Keep in mind that single footage sequence can produce many clips for use and you can place them in one of the other video tracks of the timeline while you use another for your final sequence. You will find that the corresponding audio of the clip will fill up the audio track below. The audio and video can be unlinked if needed but for now you can let it be.

Each scene of your story will have a number of shots - with action, reaction, pauses, environmental views, images, text - and a number of other things which you may choose to include. You can keep things minimal or work with many clips and cuts. The process for all of them is the same. Once your media files are in the timeline you will primarily use two tools - Selec-
