

tion and Cut/Blade/Razor. If you are happy with the clips you've cut from the preview then no further editing is required and you can place one clip after another till your story is done.

But in many cases you will find that as you watch the footage play in the right side playback window, which plays your timeline footage, that perhaps a few seconds need to be cut here and there. Using the zoom tool you can get close up to the cut points and switch to the cut tool to make precise cuts. You can close the gaps between clips by either using a Ripple or Gap delete option or slide the gaps till they lock together using the mouse.

Each editing tool has its own set of keyboard shortcuts which make it very simple to enact different commands like - In Marker, Out Marker, Insert Marked Clip, Razor Tool, Selection Tool, Zoom Tool and others. Getting the hang of these shortcuts can vastly improve the speed and effectiveness of your edit so you're not losing time and focus searching for the next tool you need to use.

Once you've gotten all your selected shots in order you can consider adding transitions in between them. Most professional projects don't play around too much with fancy transition effects other than FADE IN and FADE OUT but its essentially a creative choice you make. You can also tweak the audio as it was recorded or lay a new layer of music below the audio. Although many editors can do this it is still best done with the help of a sound designer or with some training in soundtrack usage.

The final step of your workflow is the exporting of your final timeline. Be sure to clear any extra clips lying around in other video tracks and making sure your audio is synched to your video. View the final file once in the editing applications timeline view and once you're ready select the Export option. The options here can vary but essentially you're pretty much done. Editing is done as much in the mind as in the tool so never replace the utility of the tool with the creativity of your imagination. Happy editing!
