

Let's get it started in here!

If you're making a movie, especially in India, chances are, the sound wasn't recorded on scene because it saves everybody time and finding a studio to dub the voices at low prices is more cost effective. But, the down side to is that the emotions portrayed by the actors on scene are very rarely revived to their fullest. Rumor has it that the famous scene that ensues between Amitabh Bachchan and his reflection in the movie *Amar Akbar Anthony* faced the same issue.

Because the post production work began months later, when Amitabh Bachchan was in studio trying to dub that scene and no matter how hard he tried, he couldn't deliver the lines the same way. Some say that if you play close attention to the audio, you'll be able to hear the clack of the Arri 2C, the camera that spurned the dubbing revolution.

To start recording sound for you home movies, the mic that comes with the camera is more than enough. But as you climb higher up the ladder of professional work, you're going to need more equipment.

That there at the end is a 'Dead Wombat'. It reduces wind noise.

Item number one in your list of requirements is a microphone, preferably a directional microphone or a boom mic. The built-in microphone on your camera is called an omnidirectional microphone and as the name suggests, it will pick up sound from all directions. A directional microphone which falls into the category of cardioid microphones will pick up sound from where you aim it.

The idea is bring the mic as close to the source of the sound as possible to capture a clean sound. Try not to go too close if there's going to be a lot of air displaced from the source of the sound. When air hits your mic, it cancels
