

to enhance the sound that comes from the mix and take it to a level that is much higher than what the mix originally was.

At the end of his session, the master gives to you the final track with which you are free to do as you please. Keep it locked away until your musical genius is discovered by your descendants or mass produce copies that you can distribute in exchange for money.

This pretty much everything you need to know before you go out and get yourself a degree or a diploma in sound engineering. We wish you good luck.

So, you neither have the time, nor the inclination to go get yourself a degree.

Here's how you do it at home

If you've managed to pick up a simple mic and a computer with some decent specs, the only thing that's stopping you from recording is a DAW.

Go pro!

Being the one thing you can be incredibly flexible with, let's look at a few DAWs.

Avid Pro Tools

Being the biggest name in professional audio recording doesn't come easy. Or cheap for that matter. Pro Tools came into being in 1999 and

sold for a whopping \$6000 then. Today, you can pick up a copy for \$700, but there was a time when it was being given away for free. Free, but with a catch.

The reason why Pro Tools was being given away was because you could get your hands on it only if you buy certified hardware. Pro Tools was released by Digidesign, a company that made hardware that ranged from mixers to sound cards to synths. Needless to say these products were expensive and only professional studios could pick them. Thus by association, Pro Tools gathered goodwill across the industry as the answer to all your professional audio requirements. When Avid acquired Digidesign and phased out the entire line, it slowly began to do away with the old model and began offering Pro Tools as a stand alone software.
