

It's got a very clean interface. The workspace is made up of a few windows. The first being the song editor. Here is where the parts of the song that don't require looping are programmed. It is composed of tracks that can be layered like the ones you would see on a DAW, each track is composed of boxes which denote one count on your beat. Double clicking on the box opens up an interface where you can place your notes in accordance to a piano roll. At the top of the song editor are the play controls.

Definitely not what we're talking about

The second window is the Beat + Bassline editor. Once again, the beats can be arranged and layered like tracks. The bass line can be programmed by clicking on a boxes. When the boxes are selected, the sample is played. By adding layers, complex bass/ beat tracks can be created which can be looped on the song editor. The composed loops can be arranged in the song editor by once again highlighting the boxes that run along the track.

The third window is the FX mixer where a range of filters can be applied to the track. A total of 64 effects comprising of three filters each can be programmed to go off at any time.

At the extreme left are a bunch of tabs from where instrument plugins can be accessed. You can also access drives in your computer and access older projects here as well. The 'My Samples' tab here allows you to import your own samples into the song editor and play them or loop them in your Beat + Bassline editor.

Once your track is complete, export it by hitting File and then Export and feel free to do as you wish.

Jargon

As you begin your journey of editing audio and making music, you will come across a lot of words that aren't used the same way in the outside world. You will also come across a lot of words that aren't used outside at all. Here's a handy glossary.
