

closer to Galactus's palette and only work on removing noticeable wrinkles and maybe toss a few blemishes out the window. But if the differences between the original and the edited image are like chalk and cheese, don't.

Keep it real

Try to keep your image as close to what you shot in the first place. While cropping is perfectly fine, if you're going to be filling light and bumping exposure to make your image salvageable, you're better off shooting with the lens cap on.

Don't edit.

Photography is all about showing the world what they missed. It's roots lie in reporting the truth. Any editing will only make your image a lie. You don't want to be a liar now do you?

Don't

Cover up

If you've made a mistake, don't try to fix it in post. Be a man, accept the fact that you missed your shot and try to develop your skills. In fact the limited shots film gives you will be instrumental in making you a better photographer.

Use blur

Lens blur, especially when you're shooting on a DSLR is sin. Instead, play with the depth of field and alter how sharp the fore and backgrounds are. For really blurry backgrounds (shallow depth of field), open your aperture, step closer to the subject and use a tele-lens (more than 50mm). Go wide, far away and close the aperture for images that are sharp all the way through.

Oh No!

Add objects

If you're going to be using post production to add things that weren't there in the first place like make up and random people, please don't. If you're going to do it to make it seem funny like having people chased by Daleks
