

noisy we are as Indians. Whether it's a horn happy motorist or your granny who's become hard at hearing, you are definitely going to pick it up unless you're adequately sound proofed.

Hands Off

This applies more to the people that pay visits to a studio and not as much to the people working there. The equipment in use is expensive and sensitive. Please don't touch and definitely don't move them around. A slightly misaligned monitor could spell disaster and many a static electricity has the potential to do lasting damage to the equipment.

EQ

While using EQ to cover up mistakes that you made while recording is a big no no. Using EQ to make the recording better is always permissible. EQ could be used to tone down some of the higher frequencies if the voice is too shrill and EQ could be used to tune up the lower frequencies to make a deep voice sound deeper and more more rich.

Don't

Leave the doors open

The studio is a sacred place and one does not simply walk in to a studio. Ensure that you do the cleaning in your home studio and definitely keep kids and pets out at all times. There are plenty of places where you can find royalty free animal and baby sounds. The same goes for visitors too.

Use Autotune

Antares Audio Technologies is the evil corporation responsible for bringing music to a point where all that matters is a cute face and a believable back story as opposed to musical talent. Auto tune works by pushing every note that goes off key back in to key. The points where the vocals seem garbled are where the singer has gone off key and Autotune has been used in attempts to "salvage" the track. All said and done, if you can't sing, take classes. Don't sell out and use Autotune.

Get your artist dehydrated

While the inexperienced ear may miss it, our lips and tongue make noise (no we are not talking about well... talking). When your mouth is dry, every time you open your mouth, your lips and tongue rub against each
