

Is it closer than we think?

With Linux having made its case across markets, this really makes us wonder whether the aforementioned 'Year of Linux' is already here. A time where a majority of all the machines run an OS based on the Linux kernel isn't that hard to imagine. After all, Google uses Linux and they're doing just fine. The android phone that's in the hands of hundreds of mil-

College, here I come

lions of people is doing fine and so are the chunk of Linux based servers the websites you frequent are hosted on.

When you throw in Chrome OS, Google Apps and the fact that between the two, you can replace your proprietary OS and software on a hardware platform that needn't be very powerful, you can develop a system that's capable of handling all the

tasks an average student or office worker needs. Why would you need a proprietary OS and apps in such a situation?

What's really holding Linux back, in the consumer space, is a lack of knowledge of its capabilities and the potential of the platform. All it takes is for a few of you to jump into the deep end and experience Linux for what it is. You might flounder for a bit but there will be a million arms ready to keep you afloat if only you ask for assistance. You'll be surprised by the result.

Is 2014 really the year of Linux?' The short answer to which is 'No, let's ask again in 2015.'
