

2. Inkscape

Inkscape is a vector graphics editing tool (think: Adobe Illustrator). While GIMP works mainly with raster graphics, Inkscape is made for working with vectors or scalable graphics – particularly for the web. It sports an object creation tool, an object manipulation tool, text support and compatibility across formats including SVG (Scalable Vector Graphics) and AI (Adobe Illustrator).

3. Blender

A 3D modelling software similar to Autodesk Maya, Blender is a fully featured tool for creating rich, detailed 3D models. It's built to take advantage of both, CPU and GPU-based rendering, and supports HDR lighting, animation, sculpting and various perspectives to get the look you need. Blender

Blender lets you create hyper-realistic looking 3D models and animations

comes with an in-built compositor, so you don't need a third-party tool. The game creation engine allows you to create rich gaming workflows, while the video editor can edit movies and video clips with audio mixing, syncing and live preview support. It comes with a Python-based scripting interface for automating workflows and creating your own plug-ins.

VI. Command Line Tools

Any discussion on Linux programs would be incomplete without mentioning a few command line tools. The terminal is where the power of
