Taking Android home screen customisations to the next level

Because tinkering with launchers and installing icon packs is too mainstream now.

B

eing an Android enthusiast can convince you to spend hours beautifying your

home screen or the entire look of your user interface. This is one of the perks of using Android phones – the power and freedom of customisation. As a beginner, you must have already played around with a bunch of wallpaper apps and custom launchers. With a custom launcher installed, custom icon packs are usually the next step. Finally, you must have moved on to putting effort in looking for the right widgets falling under your desired aesthetic. The possibilities are already endless with the previous steps already. However, it starts feeling like a drag

after some time. You'll be doing the same things over and over again. To break free from all of this, we have several recommendations for you. Our suggestions will help you move on from a beginner level of customisation to a more intermediate stage.

BASIC HOME SCREEN CUSTOMISATION

The easiest way to change the look of your home screen is to slap on a new wallpaper. You will find countless number of apps that compile wallpapers from different sources such as Backdrops, Walli, Wallrox, etc. Icon packs can be installed only if they are supported by your launcher. If you wish, you can go for custom launchers like Nova, Evie or Microsoft launcher. Then you can go ahead and install icon packs, few popular ones including Polycon, Moonrise, Glim, Fondos, etc. After icon packs, you should probably check out custom widgets. You

will come across a few where our recommendation would be Zooper Widget and Kustom Widget Maker. The advantage with the latter is more control over all the elements whereas the first one is all about presets and minimal customisation.

If you're new to Android customisation, you will have a ball of a time with the previous suggestions. The curiosity of wanting more will eventually bring you to the following tips to customise even further.

CUSTOMISE YOUR OWN WALLPAPER

We'll start off with some basic wallpaper editing apps like Tapet. This app consists of a collection of patterns and designs, further expanded with colour palettes. You can continue swiping up and down through the collection until you come across a wallpaper you like. Once you have a selection, you can swipe right and left to cycle through the colours. After you've settled on a particular combination, you can apply it as your wallpaper.

Tapet: <http://dgit.in/Tapet>

Moving on from static wallpapers, we look at 3D wallpapers. They rely on the parallax effect giving you the illusion of a 3D image in the background. You will find a few 3D wallpaper apps but the one you should be installing is called 3D Wallpaper Parallax 2018. The others will let you select a 3D wallpaper from a collection. This app additionally allows you to create your own 3D wallpaper. You can either choose
