3D Wallpaper Parallax 2018: <http://dgit.in/3DWP18>

Live wallpapers look amazing. Wouldn't it be great if you could create your own live wallpapers? Kustom Live Wallpaper Maker lets you browse through a collection of presets and edit them according to your needs. Once a preset is loaded, you can edit the most fundamental element in that live wallpaper such as a shape or text. You can add images or just stick to solid backgrounds. You can change the fonts and even the size of the text. The app has a pro version that gives you access to a bigger list of amazing presets that completely revamp your home screen.

CREATE BASIC ICON PACKS

If you'd thought that icon packs can only be created in professional image editing software, think again. You can experiment with custom icons packs at a basic level right from your phone using Icon Pack Studio. The app drives you through several steps to pick the design of the icon including shape and colours. After the basics have been done, you get to further edit the looks of the icon. You can add shadows, strokes, etc. When you're satisfied

with an icon, you can preview how it will look and then export it as an icon pack. Install the exported APK from the notification menu and apply the icon pack from your default launcher. Enjoy your new custom icon pack. **Icon Pack Studio:** <http://dgit.in/IconPS>

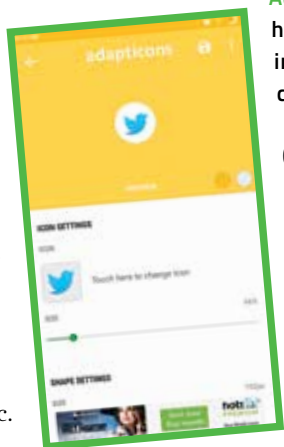

Another app called Adapticons

lets you create custom icon packs. This app has an advantage of letting you create icons of individual apps installed on your phone. Say you want to edit the Twitter app icon. You can select the icon from the list and follow the steps.

Here you get more freedom to play around with the icon's design. Their collection of preset icons for popular

apps can also be used. Additionally, you can also turn the colour of the icon into black and white.

the three buttons. To bring them to life, we will check out two apps that allow you to make reactions to actions. NavBar Apps is the simple one which gives you a few fun options to try out. Just like your status bar changes colour based on the active app, your navigation bar will also pick the colour of the app. Or you can simply assign any solid colour you like. You can also make the navigation bar reflect the battery

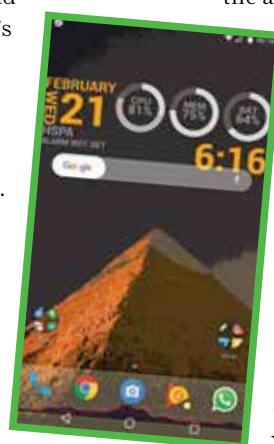

percentage, display an image, add emojis in the background or display music bars based on the song playing.

NavBar Apps: <http://dgit.in/NavApps>

NavBar Animations has a list of several animations that can be added to the navigation bar. All you need to do is enable the animations from the app and select your

desired animation. However, most of the animations are only available in the pro version.

If you want better looking visualisations when music is playing, you should check out Muviz. It works just like NavBar Apps but here you have the option to display the visualisations on the status bar, in the navigation bar or right above it.

You also get to choose from a rather long list of amazing visualisations.

CONTROL YOUR NAVIGATION BAR

This particular tip only applies to phones with software navigation buttons at the bottom. Unless you have a custom theme installed, your navigation bar simply looks dull with

So what are you waiting for, don't be stuck with a standard Android look, or the look your device manufacturer chose for you. The whole point of having Android is to customise it. Send us your best work, and if we like it we'll feature it.
