Teardown: Apple HomePod

Smart speaker or dumb speaker?

Abhijit Dey | abhijit@digit.in

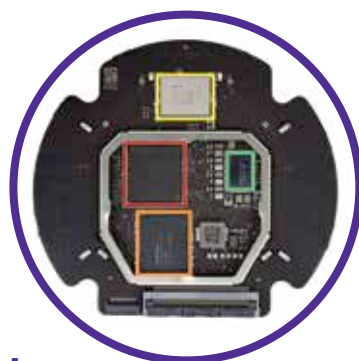

Special mesh design

In order to prevent dust and debris from sticking to the outer fabric of the speaker, Apple engineers developed a particular mesh. The mesh design ensures that the audio output isn't affected.

Subwoofer on top

Usually, speaker systems employ the subwoofer at the bottom. On the HomePod, the subwoofer is placed on the top, right below the touchscreen.

Smartphone processor power

All the magic on the HomePod is powered by the Apple A8 SoC. This is the same SoC that was released with the iPhone 6 and 6 Plus.

Audio output calibration

The six microphones circling around the speaker will detect whether there are walls around it. Based on that data, it will create virtual audio beams in order to accurately direct the sound in the room.
