

GOSPACE

Funding: \$82,086 of \$20,000 goal

Link: <http://dgit.in/GOSPACE>

GOSPACE is a wireless external drive which comes with Qi charging and 5G streaming capabilities. The main difference between GOSPACE and other storage devices is that in this case, you've got a portable cloud storing your data. And since you're moving data at 5G speeds, transfers are pretty darn fast.

One of the advantages of cloud storage is of course, you can extend it without limit. GOSPACE can connect with up to 8 devices at the same time. You can also connect your Dropbox and Google Drive accounts to GOSPACE.

The device features a 5.5K mAh battery, so it's got pretty decent battery life. It's got an effective range of 50M as well, so having it in a central location should be more than enough for the most part. And of course, thanks to 5G speeds, you've got some crazy fast transfer speeds. Fast enough to stream your movies and music wirelessly with ease.

GOSPACE also features an SD Card slot, a USB-C port, and a USB 3.1 port in order to transfer data to and from your computer with ease. Like with all things these days, it also comes with its own app which lets you track everything stored on GOSPACE. Check them out on Kickstarter.

Lexip Gaming Mouse

Funding: \$254,499 of \$30,969 goal

Link: <http://dgit.in/lexip>

There's a lot of gaming mice out in the market so what does the Lexip gaming mouse have that makes them stand out from the crowd? Apparently, it's got two joysticks merged into it. Yea, that does make it stand out of the crowd. But how does this integration of joysticks with the mouse even work?

Well, the first joystick is internal (inside the mouse itself), and its controlled by tilting the mouse's shell. Basically, the mouse's body itself can be moved up, down, left or right while the base remains stable. So you're basically tilting the mouse's body in the desired direction and it can tilt by up to 20 degrees. This one sounds a bit confusing.

Okay, where's the second joystick? Well this one is more obvious. The second joystick is controlled by the thumb, so where your thumb would normally sit when using a mouse, there's an analog stick over there. This one definitely looks like a joystick and can move up to 30 degrees in all directions.

It's a gaming mouse in all aspects, so you can expect other features like high dpi and the ability to be able to customise the dpi to your liking as well. It definitely looks and sounds cool, but we'd love to actually get our hands on it and try it out.

SonarPen

Funding: \$37,933 of \$25,568 goal

Link: <http://dgit.in/SonarPen>

The SonarPen is a smart pen for the iPad that's battery-less and pressure sensitive. It's powered when you connect it to the iPad (or iPhone) via the 3.5mm audio jack. Ironically enough, you'll now need an adapter to use it with the newer iPhone models. This particular device is obviously targeted towards the more creative folk or those who like to doodle a lot. Of course, if you're

actually into digital art it's a handy tool to start with or venture into digital art with. A good place for beginners to start is what we're getting at. Maybe before you con-

sider getting yourself a professional tablet like a Wacom or something.

The SonarPen is comparatively cheap for the features it offers, which is great.

And you've also got the option to get a magnetic pen-holder along with the pen. The SonarPen should work fine with all iPad models save the first gen iPads. You can grab yourself a SonarPen for as little as \$25 on their Kickstarter page right now.
