Antec P8 vs Corsair Carbide SPEC-04 TG

Tempered glass side panels have finally entered budget mid-tower cabinets

Abhijit Dev | abhijit@digit.in

T

empered glass side panels have been rising in popularity since the last couple of years. Initially,

they were introduced as a premium feature in the higher-end category. Now they are entering the mid-tier and budget range of cabinets. You won't be getting any functional advantage as they are only meant for their aesthetic value. Compared to acrylic side panels, tempered glass is scratch-resistant and more durable. But it's glass after all and it is prone to shattering. You should probably avoid

them if you're clumsy. However, who in their right mind wouldn't show off their beautiful RGB LED-lit components to the world? By spending some extra time in cable management, you can achieve a neat build as well. The Antec P8 was recently launched at an attractive price of just ₹5,300. This probably makes it the most affordable cabinet with a tempered glass side panel in the local market. The Corsair Carbide SPEC-04 was originally launched with a transparent acrylic side window panel. They realised the demand and decided to launch a tempered glass variant of the same

cabinet for ₹7,999. Both of these cabinets will go head-to-head this month and only one shall be crowned the winner.

TESTING RIG:

- Motherboard: AsRock X79 Extreme9
- CPU: Intel Core i7-4960X
- GPU: Sapphire Radeon HD 7790
- RAM: Corsair Dominator 2x8GB DDR3 (16GB)
- HDD: WD Red 2TB
- SSD: Kingston SSDNow V300 (120GB)
- PSU: Antec HCP-1000 Platinum
- CPU Cooler: Noctua NH-L9x65

BUILD QUALITY

ANTEC P8

The steel frame of the P8 is durable enough to prevent any kind of bending. The same is the case with the motherboard plate and fan mounting parts. All the SSD trays are also made of steel indicating durability even in the small components. There's a layer of steel on the front plastic that makes it stronger. Coming to the tempered glass panel, the thickness is uneven. It lingers between 3.5mm to 4mm at the edges. Just like other cabinets, the tempered glass panel protrudes a little from the chassis. This indicates that the cabinet's main frame wasn't made for the tempered glass panel. Rubber grommets around the motherboard cutouts are rare to find in the budget segment. In terms of padding, the PSU bay and bottom standoffs are the only places where you'll find rubber. Overall, the build quality on the P8 is impressive.

CORSAIR CARBIDE SPEC-04 TG

We didn't find any structural weakness in the main steel frame of the SPEC-04. Although the front panel is made of plastic, it is dense and durable. The removable HDD drive cage is too flimsy and bends easily when removed. Otherwise, when it is screwed into the cabinet, it doesn't bend. Both the cabinets have almost the same kind of dust filters, the exception being that the SPEC-04 doesn't have a top filter. If you aren't attaching exhaust fans on the top, cover it up. Compared to the P8, the tempered glass panel here is more uniform – just under 4mm throughout. The same four corner screw mechanism is used and the panel protrudes from the cabinet here as well. There aren't any rubber grommets in the motherboard plate cutouts. The HDD trays are made of plastic with no rubber padding. You will only find rubber strips on the PSU bay and standoffs.
