## FEATURES

### ANTEC P8

The highlighted feature is the tempered glass panel. It has a subtle black tint to it. This ensures that the lights shining from your components aren't hard on the eyes. The glass attaches to the cabinet using four screws at the corners. Although it holds onto the cabinet well, it's a pain to remove all of them to get access inside. Two HDD drive bays are found inside the PSU shroud. If you aren't going to use HDDs, then you should remove the drive cage to make room for those extra cables. You'll still find enough room to stash away the cables under the PSU shroud. There aren't any optical drives in the cabinet, making more room for cooling options and maximum GPU length of 390mm. The motherboard plate has a CPU cutaway in case you want to replace or tighten the CPU cooler without taking out the motherboard. There are two USB 3.0 and HD audio ports on the front panel. You can attach three 120mm or two 140mm fans on the front and top panels. On the front panel, you can install a radiator up to 360mm. Whereas the top panel supports a maximum radiator length of 240mm.

### CORSAIR CARBIDE SPEC-04 TG

Apart from the tempered glass side panel, the most highlighted feature is its angular design. It's unique to the company, borrowed from a different product. It follows the same mechanism of attaching the tempered glass panel seen in the Antec P8. You can install three 120mm and two 140mm fans on the front panel. If you install the third 120mm fan on the front panel, it has to be a high static pressure fan since the HDD drive cage will get in the way. On the top you can add two 120mm fans. Radiator support is limited to 120mm or 140mm on the front panel. The top panel doesn't have enough clearance for radiators. There are two slots for SSDs near the front panel. You get GPU clearance of 370mm and if you wish to add another GPU, you will have to remove the HDD drive cage. The I/O ports include a USB 2.0, USB 3.0 and HD audio ports. Without any PSU shroud, you are expected to spend time on cable management. After all, you wouldn't want all the cable mess visible behind the beautiful tempered glass panel.

## COOLING PERFORMANCE

### ANTEC P8

Without any load on our testing rig, the CPU and GPU lingered at around 36 and 39 degrees Celsius respectively. Primary testing is done with the factory shipped fans. When the system was put on load, the three fans kept the CPU and GPU temperatures at around 64 and 67 degrees Celsius respectively. Because of the low score in idle temperatures, the P8 lost to the SPEC-04 by a small margin. This score was possible because of the three included fans. You can obviously achieve a cooler system with extra aftermarket fans.

### CORSAIR CARBIDE SPEC-04 TG

After keeping the system idle for 30 minutes, the CPU and GPU settled near 30 and 38 degrees Celsius. When we ran our stress tests, things got a little hot. The CPU touched 70 degrees while the GPU went up to 65 degrees Celsius. Since there was only one fan, a constant airflow wasn't maintained. This bumped up the temperatures massively. But since there was so much open space on the top and rear without any dust filters except in the front, the idle temperatures were low.

## CONCLUSION

The budget segment of cabinets often has the same set of features and build quality. However, there are times when few things are ignored that lead to inconveniences. Although both the cabinets have the same level of build quality, the Antec P8 ensures takes a slight edge in features. The absence of the drive cage opens up room for better radiator support. With the introduction of a tempered glass panel, you are expected to take extra measures to route your cables

and keep the setup clean. With the PSU shroud, the Antec P8 takes away the hassle. Coming to cooling performance, the SPEC-04 takes the lead because of better idle temperatures. The difference in cooling performance is also quite close and the addition of aftermarket can effectively improve the performance in both. But the biggest factor deciding the winner this time becomes the price. The original Carbide SPEC-04 was launched at ₹5,499. By just adding a tempered

glass panel, the price was bumped up to an absurd ₹7,999. In comparison, the original cabinet costs \$50 in the US while the tempered glass variant costs \$60. The price disparity in the Indian market doesn't make sense. On the other hand, the Antec P8 is listed at \$90 while it was launched at ₹5,300 in India. So, naturally with such a low price offering a bunch of useful features along with the tempered glass panel, the Antec P8 wins the head-on.
