

## Japan self driving

Nissan Motor and DeNA announced field tests of Easy Ride, the self-driving taxi service they developed together, will begin next month in Japan. <http://digit.in/japSD>

## AI spots kidney injuries

Google subsidiary DeepMind aims to tackle Acute Kidney Injury (AKI), working with the U.S. Department of Veterans Affairs. <http://digit.in/DeepKid>

# Razer Kraken V2 Pro

## A sturdy and comfortable gaming headset

**T**he Razer Kraken Pro V2 improves over a few flaws with the older design and forms a worthy choice for gamers. There's an aluminium unibody supporting the entire headset. Not only is it strong, it's more flexible indicating higher durability. However, the coating on the ear cushions is still the same. In our experience, they start to wear out after a couple of years. To tackle that, Razer made the cushions swappable. You will be able to buy oval-shaped or circular ear cushions later and swap the existing one out. The clamping force is lower, but enough to stay on your head in spite of minor jerks. Overall, the build quality

is impressive while delivering a comfortable headset to use for hours.

The Kraken Pro doesn't offer exceptionally brilliant audio performance which is the case with most gaming headsets. Its

sound signature has a lot of enhancement done on the lower spectrum. You will be able to feel the bass-heavy

explosions and gunshots. This also makes it favourable for EDM and trap music. However, it doesn't feel overpowered to the extent where you feel uncomfortable. The retractable feature of the mic is quite useful with the in-line volume and mute control taking it further. The Kraken Pro V2 is slightly expensive for its price and performance. We would recommend the ASUS Cerberus V2 for its lower price, similar features and build quality. It delivers almost the same mic performance but performs better in audio quality in games and music. If you're a Razer fanboy and want an analog gaming headset, look no further.

—Abhijit Dey

### SPECIFICATIONS

FREQUENCY RESPONSE: 12-28 kHz | IMPEDANCE: 32 Ohm | DRIVERS: 50 mm | MIC FREQUENCY RESPONSE: 100-10 kHz | MIC SENSITIVITY: -38 dB (+/- 3 dB) | WEIGHT: 322 g

# AMD Ryzen 5 2400G

## The APUs are back

**A**MD Ryzen APUs are finally here bringing the power of the new Zen architecture clubbed with Radeon Vega graphics to provide much needed competition for Intel CPUs in the entry-level and mid-range segments. The 2400G is built on the same 14 nm process node as previous Ryzen CPUs and has a 'G' suffixed at the end to indicate the presence of an IGP. This follows the same marketing that Intel has for its KabyLake-G CPUs which also use Radeon cores for the IGP but is yet to be launched for desktop. The base and turbo clock speeds of the Ryzen 5 2400G make it better than the Ryzen 5 1500X except for the reduced L3 Cache. These

numbers rival what the 1800X was capable of, which would indicate that these two new APUs offer the best that Zen silicon is capable of. The reduced cache seems to be the outcome of moving to a 4 core per CCX configuration as compared to the previously used 2+2 configuration. Another key improvement is how Precision Boost 2 works

giving the CPU more headroom to hit higher clock speeds when needed. Cinebench scores peg it a tad lower than the Core i5-8400, however, when it comes to gaming the Ryzen 5 2400G is way superior. While the 8400 can barely produce passable frame rates in AAA games on medium settings, the 2400G produces roughly double. Such is the case with Company of Heroes 2, Metro Last Night and HITMAN. In HITMAN, the 8400 only managed 22 FPS while the 2400G did 61. It would appear that these APUs make discrete GPUs such as the GTX 1030 unwanted in budget configurations.
