

GOOGLE CARDBOARD DIY

Google Cardboard was the DIY project that kicked off the VR craze on our smartphones. And it is surprising how something so fun can be made using just some glue and cardboard lying in your cupboard.

MATERIALS NEEDED

1. Five A4 Sheets of printer paper.
2. Five A4 Cardboard sheets
3. A pair of sharp scissors,
4. A box cutter
5. White Adhesive/ Craft Glue
6. A pair of 37mm convex lenses (you can easily get online for around Rs 200.)
7. A tiny strip of velcro.
8. A stainless-steel ruler
9. You can download the template from Google Cardboard's official website, however, we found one on Instructables.com that was much easier to work with, as it had already scaled the template, making things quite simple. You can get it from instructables.com/id/Google-Cardboard-20

STEP 01 Print the template and align them according to the stipulated order. Notice that the template has a set of numbers on them. The numbers signify the order in which the parts are supposed to be attached in. (Ignore the button template as we'll use our fingers through the nose hole to interact instead) There are numbers within the circle, as well as outside the circle. The lighter circled number is supposed to be glued over the darker circled number; whereas the numbers without any circle reveal the order of the layers.

STEP 06 Always keep the cutter setting to the minimum. It not only makes it easy to manoeuvre through the curves but it also helps to prevent yourself from getting sliced along with the cardboard.

STEP 02 Cut out the templates, and glue the circled numbers as indicated. Once you've glued the circled numbers, glue the cutouts to the cardboard sheets. Ideally, you're supposed to go for corrugated cardboard- the brown ones which are used for shipping stuff. However, you can also go for a thicker mount board that is not only strong but also easy to cut.

STEP 04 The trick here is to first cut out big chunks using a cutter and then cut closely using a sharp pair of scissors. A steel ruler would come in handy to get the cuts in a straight line.

STEP 07 Cutting the circles and curves can be a real task. In order to tackle this, use a slim-profiled cutter and pierce through the board in every angle, till the cutout pops out. The circle doesn't have to be smooth.

STEP 03 Once everything is dry and stuck nicely, cut out each component. The black line on the template signifies that it needs to be cut, whereas the dotted line signifies that it needs to be folded. There is a third set of jagged lines that means you need to stick a specific component on top of it.

STEP 05 Apply adequate pressure while slicing the cardboard. Don't try to work hastily, as it can result in the cuts going out of line and you might end up cutting yourself.

STEP 08 After finishing the cut-out phase, place all the components on top of a table, and check the numbers for its order. It's time to fold now!
