

MORE DIY PROJECTS TO TRY OUT

Apart from the ones showcased in these pages, there are tons of interesting DIYs out there for you to try out. Here are some of the ones that the team liked.

Aditya Madanapalle | aditya@digit.in

PROPELLOR CAR

This is an electric car made out of RC helicopter propellers and a 9 volt battery. The propellers are available for cheap in hobby shops or online. This build uses bottlecaps for the wheels, but you can replace that with something else. There is no remote control though, so the car will just go straight ahead. A good build to amuse kids.

TREBUCHET

One of the coolest things about the Medieval Period was the Trebuchet. You can build one of your own but it will require a large box, because this build takes considerable space. It can also launch payloads in excess of 50 feet.

BLUETHOOOTH SPEAKERS

Feeling that it is the time to go wireless, but still have perfectly functional old speakers lying around? You can give them an upgrade with just a TDA7492P Bluetooth receiver and amplifier chip. Even if you do not have spare speakers, you can get new ones from an electronics store for as little as ₹35 each. Although there are electronics involved, the chip does most of the work, and the connections are minimal. Check out the build here:

LABO BY NINTENDO

These are not out yet, but are a collection of cardboard DIY kits that Nintendo intends to launch for the Switch. The creations include a remote controlled car, a piano, a motorbike and a house, that all incorporate the Joy-Con controllers in some way.

TOY GUNS

The YouTube channel of Blackfish teaches you how to build a veritable arsenal of functional cardboard guns. There is a template for an assault rifle, a sniper rifle, a shotgun and a pistol, among others.

HYDRAULIC ARM

This is a fun project that uses corrugated cardboard, a few 8 ml syringes, a bit of tubing and toothpicks to make a working hydraulic arm. The arm rotates, grasps objects with a surprisingly strong grip and moves them around for you. Apart from getting a cool arm to keep around, you will also understand how hydraulic systems work. This is an all encompassing and time consuming build, and will set you back by about ₹300.

RASPBERRY PI

A forum member by the name of E on the Raspberry Pi forums has created a printable case, called the Punnet, that can be modified according to the needs of the user. If using for a long time, print on heavy paper, over 210 GSM.
