

Gordon Freeman in FF XV

PC version of Final Fantasy XV lets you play as Gordon Freeman from Half-Life. <http://dgit.in/FFXVGordon>

Anti-cancer nano-factories

Scientists have discovered a way to sneak synthetic sells into tumor tissue where they can produce anti-cancer cells from the inside. <http://dgit.in/anticancer>

OPPORTUNITY DOESN'T KNOCK TWICE

"And this is where the magic happens, where the sun is 'made'," air quoted Omi as they entered the Solar Fusion Generator room. Theta had never seen a beam-beam collider of such magnitude. The well of the collider tube bored deep into the Earth up to a depth of 100 kms and extended another 150 kms into space. The diameter was also 150 kms and a 471 km circumference. It seemed to go on for years. The walls of the well were covered with omidion, the metal found only on the solaroids home planet and used as the insulator to seal the radioactive chamber.

"You know this is not technically a beam-beam collider..."

"It's a beam-beam / initialized fusion reactor, right? It accelerates the hydrogen and helium particles and collides them to create the fusion with the helion particle acting as the catalyst. The beam-beam particle accelerator and antimatter-catalyzed nuclear pulse propulsion systems have come a long way in the past half century, haven't they?" Theta said without even thinking twice. His attention was on the layout of the room. If his plan was to succeed, he needed to know exactly where all the entry and exit points were.

"So is there like a reporting time or something?," he asked as they walked around the room.

"Well, everybody usually comes in by 10 am. Andre, that's the solaroid at the door you saw, acts as the gatekeeper and time checker for the engineers"

"And what if I need to check in on the hydrogen and helium silos? I will check with the chief but I don't think I will need to look after the helion silo seeing that it comes from their home planet."

Omi frowned, "I don't think that's part of your responsibilities..."

"Hey I know, just showing some initiative. I am sure corporate culture doesn't change much across galaxies", winked Theta jokingly.

"Ha ha, of course you are right. And good thinking too. Let's go to the silo room." He opened a side door marked "Danger" that led to another gigantic room housing the three silos. The hydrogen and helium were the biggest ones, each standing at 1 km tall and dwarfing the helion silo at only 200 feet.

Theta walked around the silos covertly checking the input/output valve. This was the key to his plan. He noticed a small door built into the side marked "Executive Engineer".

"What's that?"

"Oh that's Tamara's office. She's the supervisor here. Head of this facility. I think she is in at the moment", he said moving towards the door.

Omi knocked and a deep, very un-Tamara like voice gave gruff permission.

"Hi Tamara, I just wanted to introduce Theta. He's the latest recruit here and he was at the top of his experimental and theoretical physics class in college. He will definitely be a great asset here."

"Oh that's nice. Welcome Theta".

Theta didn't say a word, he was busy looking at the reactor and plant blueprints that lay open on her table. There

was also a folder titled "Helion: Extraction and Usage" right next to it. On the wall behind her were a set of controls for the silo valves and for the plant ventilation system. From a quick glance he could tell the the silos could be emptied into the building air control system. He noticed the helium filter mask on the wall and quickly scanned the room for a hydrogen one. But there were none. Theta froze. This could only mean one thing.

Theta realised that he had to move up the timeline of his plan. This was an opportunity he could not afford to lose. The new information changed everything.

"Theta, Theta, hello?", queried Tamara.

"Oh hey sorry, nice meeting you. See you around", said Theta, motioning for Omi to lead the way out.

Particle accelerators are sexy!

Omi stepped out of the room only to hear the door slam shut behind him. Before Tamara could say "What The..." Theta knocked her out cold with the fuel cylinder of her hovercraft parked next to the door. He tuned out Omi's incessant banging on the door and his frantic shouts as he hurried to the table. Time was of the essence here. He knew he didn't have long. He picked up the folder and quickly glanced through it.

"Just as I thought. Helion is the sun, it's the sun particle. We can kickstart the sun again with this", he thought to himself, relieved that people on planet Earth did have a solution to restore the sun.

He turned his attention to the control systems. He opened up the helium input valve, closed the air ventilation regulatory valve and let the helium engulf everyone and everything in the factory. The cacophony outside had not died out but had now turned into screams and shrieks in shrill high pitched notes. That's how he knew the helium had been released. The last thing Theta's mind registered was the door swinging open and Andre shooting a laser gun right at his chest.

"And that's my salvation", were his final words as the blood started flowing. His eyes turned watery, but the last thing he saw was Andre crumple from inhaling the toxic fumes of helium. Three minutes till the sun restarts. Now that we know how to kill them, I hope humanity doesn't ever meekly surrender ever again', was his last thought before he died along with the 3,600 humans and 18 solaroids in the facility.
