

Suzuki e-Survivor concept

The Suzuki e-Survivor concept is just a first glimpse at what Suzuki claims is a durable, versatile platform that will power its EVs in the future. The company showcased the e-Survivor concept at the Auto Expo 2018, and it is this concept - the ladder frame chassis holding the all-electric powertrain and driver assist units, which will play host to the company's future EV ambitions. The Suzuki e-Survivor itself is more like what Richard Hammond would call a bug-out van, although we doubt it to have similar design elements when it goes in production soon.

Mahindra: e-KUV100 NXT, e2O NXT, Udo and Atom EV concepts

Perhaps the company that has made the biggest splash on EVs is Mahindra. The company brought a bunch of electric cars to the Expo - the e-KUV100, the Udo and Atom last-mile CEVs, and an all-new e2O NXT with updated interiors, touchscreen infotainment system and more. With this new portfolio of cars joining Mahindra's electrified car list, the company is aiming to gain a head start before major car makers start bringing their electric cars to India. As such, the company is attempting to improve their cars' lifestyle appeal, alongside providing better overall range and a wider network of EV charging stations across the country.

Tata Motors: Tigor, Tiago, TaMo RaceMo EVs

Tata Motors' pavilion was all about the two concepts that it presented, but beyond them, a crop of Tata's present cars got electrified. The popular hatchback Tiago, and its compact sedan brother Tigor will now be offered as EVs in the mass market segments. This is only the beginning of a journey that saw Tata Motors bag a joint contract alongside Mahindra to deliver the first crop of EVs to the Government of India-overseen EESL, and now, the cars will be available for car buyers across India, too. The TaMo RaceMo, meanwhile, now gets an all-electric powertrain to match its design prowess. The all-electric RaceMo is not a concept, but seeing how the RaceMo is for the time being more of Tata's ambitious garage project than immediate production line contender, we do not expect to see it on road very often.

Honda: Sports EV, NeuV concepts

Much has been said and written about the Honda Sports EV and NeuV concepts already. The former is the adorable all-electric sports tourer that harks back to the first Honda cars of the '60s, while the latter is a new-age take on a hatch wagon that will take its spot in ride sharing models of the future. What's common are the platforms these two are based on, the bunch of driver assistance technologies delivering up to level four autonomy, the gigantic curved OLED display that recognises touch, natural speech and gestures, and the overlaying future-oriented approach that these two have. Honda may not have launched an electric car in India already, but by presenting these two, have shown its clear intent that by the time the market of electric cars in India truly starts maturing, they will be ready with a lot to offer.
