

DROOLMAAL

Astronomia Tourbillon Clarity Octopus

It's been a while since we've done droolmaal, so what better way to start than with a \$944,000 watch! When it comes to watches, Jacob & Co. have been known for their rather unique designs, pushing the limits of imagination. And with the new Astronomia Tourbillon Clarity Octopus, they continue to do so. That is actually what's it's called, and as you can see, for very good reason.

The octopus sitting snugly in the centre of the watch immediately catches the eye of anyone whose gaze falls on the watch. Once the watch has your full attention, you'll start noticing the intricate details, like how the octopus' tentacles reach every part of the watch. The octopus itself is made of titanium and is hand-engraved and lacquered.

The watch has a lot of movement within it. You've got four elements within the watch, one is the blue and gold Earth globe, which rotates on both its vertical and horizontal axes every 60 seconds. Next you've got a spherical, faceted diamond which also rotates once every 60 seconds on two axes. The hour and minute indicators are directly opposite to

the incredibly complicated looking triple-axis tourbillon. But that's not even the best part; the entire thing, octopus and all, rotate on a central axis and complete one rotation every 10 minutes. That's a ridiculous number of moving elements and would have taken an impressive amount of skill and craftsmanship to pull off.

Even the watch's case is incredible impressive, crafted from sapphire crystal and pink gold. The sapphire crystal has an anti-reflective coating and is completely see-through, allowing you to observe the insides of the watch from any angle. There are no crowns on the side of the watch, instead, adjustment is down via fold crowns behind the watch. No wonder the watch is worth almost \$1 million!

Apollo Intensa Emozione

The Apollo Intensa Emozione or Apollo IE is an upcoming supercar from Apollo Automobil. The name stands of Intense Emotion (duh) in Italian and like the name suggests, it's definitely intense. There are just 10 of these cars in the world, each priced at €2.3 million! This car is a strictly track-only, road-illegal vehicle.

The car is entirely carbon fibre through and through. The chassis, the tub, crash boxes, front and rear body panels, it's all carbon fibre. The entire car weighs just 1,250Kg according to Apollo, which is light. Really light. Theoretically, since the claimed net downforce at 300kmh is 1350kg, this car could drive on the ceiling at top speed. Theoretically, of course.

Powering the car you've got a mid-mounted 6.3-litre V12 churning out 780 horsepower. Chief Designer Joe Wang is not a fan of the more modern hybrid systems, and as such, the Apollo IE has no turbocharger, or supercharger or nitrous or hybrid-electric systems. The engine is supposedly related to Ferrari's F150 project, but has been reworked by Autotecnica Motori, Apollo's engineering partner. The Apollo IE can do 0-100kmph in just 2.7 seconds and hit a top speed of 335kmph.

In terms of looks, well, it's definitely a supercar, there's no denying it. It has all the cool edges and angles and curves and is, well, just wow! That's some batmobile level design there.

One that can actually set the track on fire. We're sold!

Now if you'd lend us €2.3 million please...
