

SECURITY WATCH

Malware pre-installed on 5 million popular Android phones

Rottensys, a malware that comes disguised as a 'system Wi-Fi service' app, has been found by security researchers to be preinstalled on millions of popular smartphones. Brands affected by this are Honor, Huawei, Xiaomi, OPPO, Vivo, Samsung and GIONEE and the campaign is estimated to have reached as many as 5 million devices around the globe.

Check Point Mobile Security, the team that uncovered the malware campaign, also found that the affected devices were shipped from one particular company, Tian Pai, although direct involvement is yet to be established. The app runs ads to generate fraudulent ad revenues for its creators. The ability to download anything from its servers also make it capable of causing significant damage to Android devices.

MOBILE WATCH

Ulefone T2 Pro

By now, you probably know all about MWC

2018 which took place at the end of February 2018. However, at every such conference, a few really good devices fly under the radar, garnering the attention of passer-bys but not the media. Ulefone T2 Pro sports

an impressive 19:9 2160x1080 display on a 6.7 inch device. It uses an edge to edge display along with under the screen fingerprint sensor to achieve a size similar to other flagships.

The device sports the first implementation of MediaTek's Helio P70 processors and is reported to ship with Android 8.1, 8GB of RAM, 128GB storage, and a 5000 mAh battery. It is expected to retail at \$380 (₹25,000 approx).

APP WATCH

Rave

Much of the video content that we consume today, on YouTube, Netflix and more, is consumed in isolation – unless you have someone in the same room as you to watch it with. Rave is an app that wants to change that by making the video consumption experience truly

social. The app can connect to a bunch of services like YouTube, Netflix, Viki, Vimeo and more and let you host 'raves'. These raves are best described as chatrooms with a video playing on top!

Along with the chatting experience, you can use a number of features to make your 'rave' unique. You can set the privacy of your rave to public, location based, friends only or invite only.

Additionally, invitations can be sent through any messaging app that you have on your phone. You can also use VoIP to communicate with other people in the room. If you're watching on a service like YouTube, you can even bypass the autoplay feature to enforce a vote to decide what plays next. Give this one a try to change your video watching experience for good.

Otter Voice meeting notes

A crucial part of meetings and lectures is remembering the topics and ideas being discussed. Otter makes that simple by providing a collaborative voice notes platform that also transcribes its notes, making them searchable.

Cosmic Watch

While we've recommended stargazing apps in the past, Cosmic Watch takes a different approach by putting Earth at the centre. You get a number of interesting features like checking out the relative locations of planets at any point in time, get a 3D constellation map around the planet and more.

Beelinguapp

There are numerous ways to learn a new language today, but this app offers a new twist to it – by teaching you through some of your favourite stories and books. It reads out audiobooks in the language of your choice, with the same in a reference language side by side.
