

SPEED TEST

Ookla's Speed Test has become synonymous with speed testing of data or internet connections. The Speed Test app does its job pretty well. However, wouldn't you prefer an app that offers better features while also fulfilling your basic need to know your internet speed? If you answered 'yes', you should check out OpenSignal's Speed Test. Apart from giving you numbers on your bandwidth,

it will also point out mobile towers and Wi-Fi hotspots near you on the map. It can also show you the areas where you can expect consistent network coverage.

GALLERY

Whether it's memes or selfies, your gallery app is something you'd open quite frequently. Phones with stock Android usually ship Google's Photos app, otherwise you get the manufacturer's gallery app. Ideally, a gallery app should have low load times and basic customisation options. Recently, Optic Beta caught our attention. The app lets you change the grid and theme easily. Images load times are pretty low and it lets you crop the image in various aspect ratios. If you're looking for a clean and fast gallery app, you should check out Optic Beta.

EMAIL

A Gmail account is mandatory if you're using an Android phone. Naturally, your choice of email client is likely to be the official Gmail app. It contains tons of features but sometimes, it can get sluggish. Long email threads, especially the ones with attachments would simply freeze and load after some time. While looking for an alternative, we came across Email by Edison. Being heavy Gmail users, we

could actually see the difference in speed in both the apps. Email by Edison seemed insanely fast. A subscription tab is present in the app that analyses all the subscriptions from emails that you most probably don't remember signing up for in the first place. All of them are listed at one single location, making it easier to unsubscribe from them. Another feature that we liked was the attachments tab where all the emails with attachments were listed in one location.

WEB BROWSER

The mobile web browser is another app that doesn't get much attention unless you're a power user. You would either use the default browser or make an effort to download Google Chrome. Most of the mobile web browsers almost have the same synthetic performance varying in optimisation and resource utilisation. But there is a certain app that offers something else other than great performance.

Flynx is a floating window web browser that loads web pages on a floating bubble while you continue doing your work. Essentially, if you're scrolling through Twitter and you click on a web link, Flynx will start loading the webpage in a minimised state on the floating bubble. Until the website loads, you can continue scrolling and then tap on the bubble to open the link when you're ready to visit the page. This lets you use whichever app you're using without interruptions.

SCREEN RECORDER

Certain manufacturers might include a screen recorder app along with the rest of the bloatware. If not, you might have probably been using AZ Screen Recorder. It definitely gets the job done but the free version is limited in terms of several features. An alternative to this is DU Recorder that packs in a lot of additional features, apart from the premium ones from AZ, for free. You can trim, convert to

GIFs, add backgrounds and music, etc., all for free. One handy feature we found in DU was shake to stop recording. Usually, you need to scroll down and then stop the recording which requires you to trim out the ending of the video. Here, the screen recording stops with just a shake.

CALENDAR

Even though Google Calendar is probably the best calendar app on Android, it isn't rich on the customisation and widget side. Essentially, we are speaking completely from an aesthetic point of view since functionally, Google Calendar can do everything well. Several calendar apps are present where some are integrated with their email apps. Out of the lot, we preferred Today Calendar. Although it's

a little on the expensive side, the free version is enough. You can change the colours of the app and integrate it with your default calendar events. The best part that we liked was the beautiful transparent widget. Give this one a shot to see if you like it better than Google's official app.
