

### Robot beats Rubix cube record

The robot was able to solve the Rubix cube in 0.38 seconds, before smashing it into pieces. <http://dgit.in/rubixcube>

### Free upgrade for Windows 10 S

Joe Belfiore, Corporate VP, Windows confirms that Windows 10 S users get free upgrade to Windows 10. <http://dgit.in/win10supgrade>

# If Memory serves me right

RAM prices have started dropping and Agent001 can finally get around to buying some much needed memory

agent001 | [agent001@digit.in](mailto:agent001@digit.in)

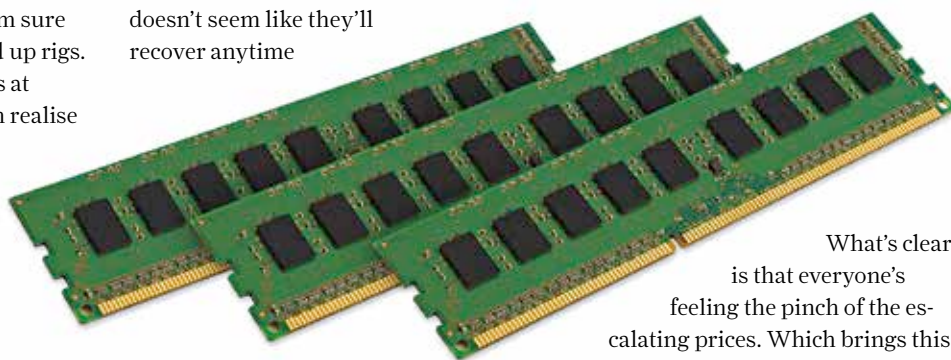

If you guys haven't noticed yet, then we've started pushing out a lot of videos on our Facebook page (<https://www.facebook.com/digitgeek/>). It's just Aditya who's doing the videos right now, and the others have decided to finally jump onto the video bandwagon. No, you'll not be seeing me in front of a camera, yet. But we've got some really neat ideas that need to be made into videos. My current PC is pretty decent and I don't need anything more than what I have. However, the others in the team sure could do with slightly spruced up rigs. If you've ever tried your hands at editing videos then you'll soon realise that your workflow is very dependent on the amount of RAM your PC has.

With about 6 more machines needing roughly twice their current memory capacities, we're looking at getting about 128 GB of RAM in total. Some of the machines will have slightly greater amount of RAM but most will be capped at 16 GB. Let's keep the details for later. What we want is RAM and a lot of it. So when we started checking RAM prices on the Internet, we were in for a nasty shock. RAM prices were through the roof. Stuff that used to cost ₹3.5K was now priced at ₹7.2-7.8K. That's more

than a 100% hike. Sure, we've heard about the incidents at the OEM factories wherein they've ended up losing a lot of silicon wafers but such incidents have occurred in the past and RAM prices had recovered pretty quickly. What's happening in the market reeks of artificial scarcity.

However, upon speaking with a couple of folks into the whole memory business, it seems that I was a bit off. Yes, the factory mishaps did dent DRAM supplies but there was another major factor that's been driving prices through the roof and it doesn't seem like they'll recover anytime

the smartphone manufacturers are feeling the pinch of the rising prices. So much that they've had to use different memory types within the same smartphone model. Last year, Huawei had mentioned the use of UFS 2.1 in their Mate 9. However, consumers opening up the unit were surprised to find certain SKUs sporting UFS 2.0 alongwith LPDDR3 or LPDDR4. Honestly, I don't know if Huawei tried to pull one over the consumer's eyes because they wanted to feed their bottomline or if they simply had no other option.

soon. The culprit, is the mobile market.

Smartphone manufacturers have been hoarding DRAM as if it were the end of days and DRAM was key to their survival. Samsung, SK Hynix and Micron are still growing their facilities and increasing output, however, their growth is nowhere enough to meet the voracious appetite of the smartphone manufacturers. And even

What's clear is that everyone's feeling the pinch of the escalating prices. Which brings this story back to our case. We still need a lot of memory and there's no respite in sight. So our plans of making a RAM-DISK and using that as the scratch disk for our editing software has been put on hold. A RAMDISK is a luxury at the moment. So we've decided to experiment with value RAM. Every brand under the sun has a value segment comprised of the cheapest SKUs they have to offer. The price difference
