overclocking. The money saved in this way can be used to opt for more RAM. Anyways, here's what we feel is appropriate.

- CPU - Intel Core i5 8400 - ₹13,700
- Motherboard - H370 Board - ₹7,000
- RAM - Crucial Ballistix 2x 4 GB - ₹6,400
- SSD - Kingston A400 240 GB - ₹5,200
- HDD - Toshiba 2 TB - ₹4,450
- CPU Cooler - Stock or Cooler Master ML120L - ₹4800
- PSU - Corsair CX450 - ₹3,330
- Chassis - Antec P8 - ₹4800

As for your questions.

1. I'm assuming you're talking about the ASUS VG248QE. It is indeed a very good 144Hz monitor and very few units come close to delivering the same performance as them. However, since it is out of your budget, we'd suggest the Acer XB240H if you want a flat screen or perhaps the Samsung LC24FG70FQWXXL in case you want an 1800R curved display. Both are decent 144 Hz monitors in their own right. However, they're also priced at approximately ₹20K each. Which brings us to the third option, the Acer GN246HL which costs ₹16.5K and is the only budget 144 Hz monitor you can get at the moment.

2. If you haven't noticed, we have only specified the chipset i.e. the upcoming H370 which will launch on April 2nd. We can't get into more details since that would mean we'd be breaking the NDA. However, what you should know is that whether you get your motherboard from ASRock, ASUS, GIGABYTE or MSI, they'll all fit your needs.

The problem with motherboards are their reduced life cycles these days. There used to be a time when motherboards would easily last 13-15 years without breaking a sweat. Now you'll be lucky if anything lasts past 6-7 years without blowing a capacitor. Any board costing about ₹7K will easily have at least one PCIe x16 slot for your graphics card, and another x8 slot for any peripheral you might want to install down the line. These ideally sport about 4-6 SATA slots and will have USB Type-C on the rear.

Lastly, you mentioned a good PSU. The Corsair CX450 that we suggested is an 80 Plus Bronze certified PSU. If you want a 80 Plus Gold then the one that fits your budget would be the Thermaltake TR2 500W which retails for ₹5,125. Both power supplies have more than sufficient connectors for all the components mentioned in your build. Another good SMPS would be the Seasonic Eco Plus 430W. Depending on these suggestions, we hope your build comes through successfully.

Xiaomi Mi TV 4 55-inch

TV FOR YOUR PS4

Q Hello and Greetings!
 Absolutely love your work and rely heavily on your reviews before buying new gadgets. I need your help again, I want to buy a 55-inch 4K HDR TV in a tight budget. Primarily for gaming on PS4 Pro. I had my eyes set on Vu 55" Pixelight HDR TV. But then came the Mi TV 4, 20% cheaper and with a 10-bit Samsung panel. Now I'm confused again. Can you please help me with the decision.

Primary usage - 4K HDR gaming on PS4 Pro. Will be used a couple of days in a week for watching movies in Full HD (from pen drive or HDD), so the upscaling should be good as well.

And occasionally for TV viewing.
 Kindly help.

—Sahil Sharma

A You're not alone in this dilemma Sahil, when the Mi TV 4 came out, it took most of us by surprise as well. Since you are on a budget, we'd say that you should go with the Mi TV 4 with your eyes closed. We haven't come across any reports of the TV going wonky except a case where the panel ended up getting damaged due to improper handling. It's really thin, so that's understandable. However, regarding your setup, might I suggest

setting up a Media Server on your PC or your NAS, if you have one.

Essentially, everything in your home, including the PS4 and the TV have Wi-Fi. So instead of using a pen-drive and having to worry about manually transcoding the movie to a compatible format, you can simply dump it into your media server and it'll transcode on the fly. Having a media server really smoothes things up. You should check out Plex, it's a very good media server with a well-thought out UI and is supported out-of-the-box by practically everyone under the sun. The money saved by getting the Mi TV can easily be spent towards getting a Plex Pass which allows you to further expand the capabilities of the software. Or if you have a NAS, they generally ship with a media server plugin. You might want to check that out as well.
