

### HTC Vive Focus

The standalone VR headset is all set to be unveiled later this year globally and is expected to cost around \$680. <http://digit.in/ViveFocus>

### Galaxy S9 dead zones on display

Some users are experiencing unregistered inputs on certain parts of the Galaxy S9's Infinity Display <http://digit.in/S9deadzone>

# DIY Cardboard Pistol

We tried our hand at making a pistol out of cardboard because why not? We thought it would be an easy project so we did some digging around, but it turns out making the insides of a firearm (even a cardboard one) are fairly complex.

**Manish Rajesh** | [manish@digit.in](mailto:manish@digit.in)

We've provided the templates for the cardboard cutouts in the DVD.

## MATERIALS NEEDED

- Corrugated cardboard (we've used mount board here and had a pretty bad time)
- Plenty of glue, if you've got a glue gun, even better, but fevicol worked for us.
- Super glue (fevikwik).
- Sandpaper.
- Rubberbands.
- Toothpicks.
- Paper sheets.
- Pen knife (or a cutter and something to make fine holes)

**STEP 01** After you've cut out all the pieces, use one of the two largest cutouts, as shown, as the base for your gun. The four handle cutouts, (as shown) are stacked one above the other, with the shorter ones stacked in the middle.

**STEP 02** Next, you stick one of the front handle cutouts, as shown, on the base.

**STEP 03** You stick the other two front handle cutouts together and place them on the cutout you placed.

Next we make the magazine. You can choose to make either the short or long one, templates for both of them have been provided.

**STEP 04** Pick one of the cutouts as shown for the base of your magazine and make holes on the dots large enough for toothpicks to pass through them.

*Note: Whenever pushing toothpicks through holes, we made sure to use super glue*

*after to reinforce the holes so that the toothpicks wouldn't accidentally come out. This is especially important for places where you use rubber bands.*

**STEP 05** Next, you need to place a border along the edges. The template for this is not provided so you'll have to do the measurements yourself but it's fairly straightforward. Make sure the height of the border is the same as the width of two layers of what-

ever material you're using or it won't fit right.

*Note: Be sure to pay attention to where you're pasting the border as it only covers 3 ends. It should have a gap near one corner as shown.*

**STEP 06** Place a rubber band across the two toothpick ends as shown. Next, take the cutout which resembles the one in the picture, but be sure to pick the one relevant to your magazine's size. There

will be two of them, so glue them together after you've made holes on the dots. Use super glue on the surface to reinforce it.

**STEP 07** Push a toothpick through the hole and place it inside your magazine shell. The toothpick end on the hammer-shaped cutout goes into the thin slit of the magazine, but over the rubberband. So pulling it down should pull it back upwards.

**STEP 08** Close the magazine (the pistol magazine, not the book) with the second cutout. Stick the two rectangle shaped cutouts together and paste it on the base of the magazine as shown.
