

Pac-Man on Holo Lens

Pac in Town' is a mixed reality game where three players run through a maze collecting dots in a specific time limit. <http://dgit.in/pacintown>

Faster future Windows updates

Windows updates will take nearly half the time during reboot, major update won't interrupting system use. <http://dgit.in/winupdate>

together and pass a toothpick through the triangular side. Be sure to reinforce this piece with super glue.

STEP 11 Next, we pass two toothpicks through the holes on the base of the gun, and one of those goes through the second hole on the small hook-shaped piece we just reinforced in the last step.

STEP 12 Place a rubber band around the two toothpicks as shown. Ideally, you want to put in the trigger mechanism after finishing the gun's barrel first.

STEP 13 For the barrel, for the thin tube, you can use finely rolled up paper about 8.5cm in length (roll it around a toothpick), but we decided to use a pen refill instead. For the base we've used the pen's own bottom cap, with paper rolled around it.

STEP 09 Now things get complicated, hopefully you've been making holes wherever there are dots on the template. Take the two trigger shaped pieces as shown, stick them together and pass a toothpick through the whole thing, base and all, as shown.

STEP 10 Similarly, there is a small hook shaped cutout, which you will need two of, though the template doesn't say so. Stick the two parts

Note: It would be too hard to explain or show how the insides of the gun were made, we don't have enough room. But, we'll include a link to the video we followed at the end of the DIY.

STEP 14 After you're finished with the barrel mechanism, you can go ahead the place the trigger mechanism in place. For this you'll need the small oval cutout with two holes, and the long slim cutout with two holes at the end. Place them as shown in image.

STEP 15 Now you can close the gun up. For this, use the cutout identical to the gun's base. If you've got everything right so far, it should sit easily.

STEP 16 Next, you've got the two parts that go on top of the base and cover cutouts. These give the handle a more gun-like feel and look. If you've got a thin, easily bendable piece of cardboard lying around, bend it into a curve and stick it to the front of the gun, under the barrel tube, as shown in the image above.

STEP 17 The final piece needs to be folded and snapped on to the barrel mechanism toothpicks. If you've got the dimensions and holes right, it should sit with ease. Reinforce with super glue but be careful not to accidentally stick this part to any other part of the gun or you won't be able to cock it.

That's it, you're done! For the video we followed, go to <http://dgit.in/diycbg>. You'll need to follow this in order to

make the firing mechanism, which we found quite complicated, but the video shows the process clearly. **d**
