

Google Play Instant

Google Play Instant allows you to play games without entirely downloading them. <http://dgit.in/PlayInstant>

Apple's WWDC slated for June 4

Apple's software focussed World Wide Developer's Conference will be held at the McEnery Convention Center in San Jose, California from June 4-8. <http://dgit.in/WWDC2018>

Once the user enters the friend's email ID, it will eventually trigger a call in the back-end to search for the user. Then after searching the back-end, the server will trigger a call to engage second's user's system to start a chat. That will open a **chat-dialog-box**. This is where, in terms of output, things get really familiar, and you might see a similarity to a number of messaging clients that you've used, since many of them follow similar design ideology.

Now the API-call to searching a friend at this point is limited by the **auth-token**. Hence we need to pass the **auth-token** in the header. (Code: <https://dgit.in/Dev8>)

As you can see the header in this request consists of **x-access-token** header parameter which indeed authenticates the request. To handle that, in the server side we have written a middleware for this purpose to authenticate the request. (Code: <https://dgit.in/Dev9>)

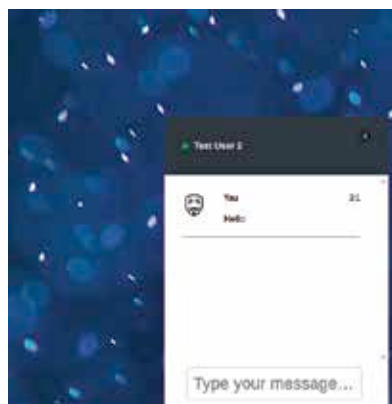

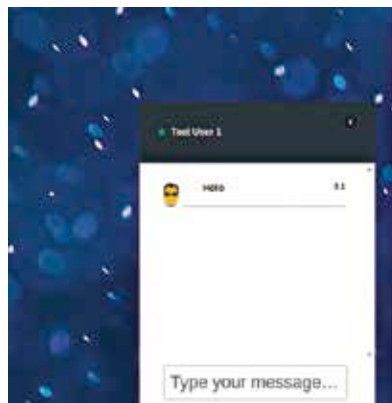

Now after logging and searching, the screens will look like this for user 1

and for user 2

Now we come to the actual chatting part of this project. At this point, if the users write something in the text box then that message will be posted to the intended user depending on who the user is chatting with.

IN CONCLUSION

This brings us to the end of our basic Electron.JS project. As this is a starter project for Electron, we have been able to just scratch the surface of what is available in the Electron ecosystem. There are quite a lot of new things to discover which can let you build more powerful and useful projects. We would definitely encourage you to visit their official site for getting more information.

*VIDEOS

*Build an Electron app in under 60 minutes

Build a minimal shopping list app with a custom menu and multiple windows and implement Materialize CSS for styling

<https://dgit.in/ElectronUnder60>

*A calculator app using Electron

Learn how to build a calculator in Electron. This is the simple project and requires some basic knowledge of HTML, CSS, and JavaScript.

<https://dgit.in/ElectronCalc>

*Developing with Electron

A video series that walks you through the basics of Electron JS and how to use it to create cross-platform desktop applications with HTML5, CSS, and JavaScript.
