

Cryptocurrency art

An artist has hidden \$10,000 worth of various cryptocurrencies in pieces of art made from lego blocks. Can you crack it? <https://digit.in/cryptart>

Teeth mounted food sensor

Researchers from Tuft University have created a sensor for teeth that can report the nutritive value of foods you eat. <https://digit.in/tthsnsr>

cluding Wynn Top 100 show playlists with Hindi tracks anyway.

You will definitely find something that you like in the Top Playlists section. The names of the playlists accurately describe the content. The content is regularly updated with the latest releases, so expect to see new stuff all the time.

Gaana's entire UI is oriented towards local content, which is a good thing. The "collections" have simple, easy to understand titles such as "rock", "pop", "melody", "kids" and "hindi". As a long term player in the streaming services industry, Gaana offers original content, and heavily depends on curation as well. There are Editor's Picks, Curated Playlists, and even exclusive tracks known as "Gaana Originals". From playlists about your favourite movie stars to the "wedding" station under the discover mode, Gaana totally understands the needs, requirements and listening habits of Indian listeners. Scroll right to the bottom and you will find a surprisingly good collection of Indie, Hip Hop and EDM tracks as well. While the names of the playlists and radio stations are a little staid, they are crystal clear in their content for all users. Gaana has a surprisingly large library, and you are likely to very rarely come across a song not available on Gaana.

Hungama has a busy interface, stuffed with the latest trending songs, artists in the news, or songs relating to any holiday around the corner. One of the plus points in favour of Hungama is that it clearly separates playlists from radio stations. Additionally, the number of songs in a playlist is clearly indicated, allowing you to choose a playlist according to the time available. The variety of the radio stations is not great, and some of the names are vague and do not clearly indicate the content on offer (Artist Aloud). The interface does

not make it clear which bits make the songs play instantly, and which ones throw up a playlist. A dedicated tab lets you watch videos, or video playlists. While having all the essentials of a music streaming service, Hungama does not really offer anything that makes it stand out.

Saavn is a mature music streaming service, with a focus on offering regional language and local content. If you are not fussy about on-demand tracks or ads, a lot of the massive library is available for free. The problem with Saavn is the discovery. Radio stations for moods, activities, musicians and actors are shown in single panels, which are categorised by language. The languages available for stations are Hindi, English, Tamil, Telugu, Kannada, Punjabi and Marathi, which is fewer than the languages offered by other streaming services. Of these, only English, Hindi

and Kannada offer radio stations for a variety of moods and services. The lack of radio stations does not really matter, as you can simply look up a song that you like, and start a radio station related to that particular song.

The playlists section is considerably more expansive, where fourteen Indic languages are available, apart from English. There are some unexpected tie-ups in here, we spotted

colour coded holi playlists by OnePlus. There are weekly playlists for Editor's picks and new music. More than the radio stations, you are likely to find lists of songs for a particular mood or occasion in the playlists section. Saavn also offers some exclusive content, including shows and podcasts but that is in the paid tier. These shows are really something new that Saavn is trying, with all kinds of content normally not

associated with music streaming services, including drama and sports.

At over 30 million tracks, Saavn offers what looks like the most comprehensive collection of Indian music among all the streaming services. The albums it has put up online goes all the way back to a 1934 release of Amrit Manthan. Although there are stations and playlists, these seem like an extra, as the focus is entirely on the on demand streaming service.

With such a large library of indic language songs, a problem and constant irritation is figuring out what spelling to use for a particular track. For

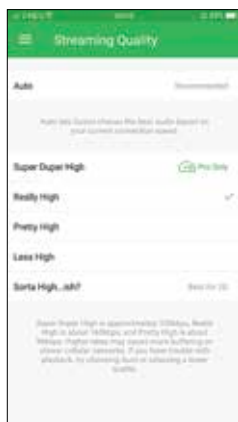

example "nanne munne bacche" does not turn up any results, but "nanhe munne bachche" does. "O palanhare" shows up an album of devotional songs, the track in Lagaan is called "O Paalanhaare". When in doubt, it is better to search for the album or movie directly or google the correct spelling.

Google Play music has a trump card up its sleeve. That is because it is a music streaming service as well as a locker. You can upload your own songs to the service, and then stream it from anywhere, say another device. You are allowed to upload up to 50,000 tracks, and Google actually plays back the exact tracks that you uploaded. The service does not replace your tracks with tracks from its library. The stations feel well-curated and they work really well. It's as if the service is like a friend with a good ear for music. The playlists tend to have good songs that have flown under the radar, as against popular and well known tracks.

The clean and simple UI makes it easy to find and get what you want. For example, stations are listed by language, category and "mood and activity". Once you choose say "waking up", you can pick between devotional, instrumental or regional language movies. There are also dance tracks listed here, so Google caters to all
