HyperX Cloud Alpha

An excellent upgrade to the Cloud series

Good gaming headsets are the ones that deliver an immersive gaming experience without compromising on build quality and comfort. The Cloud Alpha manages to tick everything from the list, thus, becoming a great choice for a gaming headset. As always, the Cloud series of headphones have shown brilliant build quality. The aluminium frame keeps the headset lightweight and flexible, while maintaining a sturdy structure. Its sturdiness is extended to the earcups and the flexible microphone. From the cables to the ear-cup memory foam, there wasn't any compromise in build quality.

HyperX is highlighting the new dual-chamber design in their earcups. It ensures that the bass frequencies are separated from the highs and mids. Essentially, HyperX has tuned the drivers to ensure that the bass frequencies

escape into a second chamber. This should make these sound frequencies distinguishable from each other and reduce the muddy nature of the previous Cloud headsets. Conclusively, the Cloud Alpha performs great in both gaming and music. We were able to distinguish the footsteps from gunshots and explosions in the background. They sounded crisp and hence, they were easy to locate.

Microphone performance was also impressive and it sounded more towards the neutral side. Of course, there's some enhancement to boost your voice, but it's only advantageous in voice communication. The only downside is that it's expensive.

ASUS ROG MAXIMUS X FORMULA

Beauty, brains and brawn

Whenever a new mainstream Intel CPU ships, enthusiasts are always on the lookout for a MAXIMUS board for their upgrade. Enthusiasts look for every feature under the sun coupled with stability and durability. And the ASUS ROG MAXIMUS X FORMULA wonderfully fits that. Anything that's not an interface is covered in this motherboard by a plastic shield. On one hand, this does protect the board but there's also the downside of a heat retention because of too many closed spaces. With the plastic shield equipped, the board looks incredibly swanky and when you turn it on, you'll see an OLED display light up with the board's vital stats right above the first

PCIe expansion slot. The I/O shield comes affixed and there's no death of connectivity on this board. The same can be said for the overall I/O on the board. However, the plastic shield can get a bit irksome when you're

playing around with the cables. If the board were to be installed in a chassis, then removing the CPU ATX power cable can be quite difficult because of the shield jutting out right underneath it. In case you were wondering, the rear of the board is well-shielded too with a massive cut-out for easy access. The board even comes with built-in water cooling support for the VRM heatsink. For the price, you're getting a pretty decent feature set and not too much of the RGB swag.
