

RetroStone

Funding: \$166,225 of \$36,814 goal

Campaign link: <http://dgit.in/RetroStone>

Retro has been seeing a revival of sorts, and this true for gaming as well, which is why you will find a plethora of retro gaming consoles out in the market and on crowdfunding sites. So what makes RetroStone a standout? Let's find out.

The first thing that'll stand out about the RetroStone as compared to most other retro handhelds in the market is its connectivity. The RetroStone has 4 USB ports and even an ethernet port. Then you've got an HDMI port on the side to connect it to your larger TV screens or monitors. This allows for some nice local co-op gaming, something the gaming industry has been craving for a while now. On the bottom of the device you have the audio jack and the volume control wheel. And there's even buttons behind the RetroStone, representing the R1, R2, L1, and L2 buttons. On the side opposite the HDMI port, you've got a MicroSD card slot and MicroUSB charge port. The device comes with an 8GB SD card, which is more than enough to hold hundreds of retro games, but you can upgrade it if you so please. It supports a host of retro consoles and formats, from Gameboy, Gameboy Color, Gameboy Advance, Super Nintendo, Megadrive/Genesis, Atari, to MaMe and so on.

LeviZen

Funding: \$117,219 of \$15,000 goal

Campaign link: <http://dgit.in/LeviZen>

The creators of the LeviZen claim they like to tease gravity, and so they've created a device that makes a drop of water levitate in the air. Of course, they haven't actually brought zero gravity to your home, but what they have done is use high frequency sound waves to make drops of water levitate in the middle of the air. And it does look pretty cool. And don't worry, the frequency is too high for human ears. Dogs though? We don't know.

What's cool is that you can have multiple drops levitating on the LeviZen, one above the other. You can also adjust their position using the control panel, which they call "The Box", that comes with the device. What's more, you can light the drops up too. There's two spot LEDs placed at the base of LeviZen which is pointed right at the floating droplet, and when it lights the droplet up, it looks like a tiny levitating light source, right in your room.

The whole thing sports a very retro look, with old fashioned toggle switches for the power on/off and light on/off buttons. There's also a knob on The Box to adjust the water drops' position. Check them out on Kickstarter if you're interested in getting one.

LeveTop

Funding: \$75,058 of \$25,000 goal

Campaign link: <http://dgit.in/LeveTop>

In brief, the LeveTop is a compact drone that can fold up, with up to 20 minutes of fly time and a 1080p stabilised camera.

The LeveTop uses a unique patented quadruple folding frame. While it's folded up, it looks like cylindrical thing, or a fancy water bottle if you will, with a camera lens at the base. The design makes it quite portable, allowing for easy storage in bags and such. Something which

can be quite troublesome with most drone designs.

The LeveTop is extremely light and has a top speed of 53 km/h which is quite impressive. Flying the drone is easy according to the creators. Simply unfold the propeller

arms and lock them in place. Then unlock the propellers following which you insert the battery. Then simply place the LeveTop on the ground and use the app to take off. You'll be able to record and capture video or photo via the app itself, and download them on to your phone instantly. The LeveTop features one click flight and landing with autonomous GPS tracking as well.

LeveTop will supposedly come with a built-in 1080p stabilised camera with a 120 degree FOV, so you should be able to shoot panoramas with it as well.
